

# Help us develop a new eating disorder screener for children and teens!

## What is this study?

We are conducting a study to create a brief questionnaire to screen children and teens for eating disorders in pediatric and primary care settings.

## Why is this important?

Eating disorders often go unrecognized in pediatric and primary care settings – largely due to the lack of screenings by healthcare providers. The new screening tool will improve detection, early intervention, and access to eating disorder care.

## Who is eligible to participate?

- Caregivers of children aged 6-12 with an eating disorder
- Teens aged 13-17 with an eating disorder
- Parents and children with no eating disorder history will also be asked to participate so we can compare responses

## What will happen during the study?

Study participants will complete a one time survey that will take ~20 minutes, and receive a \$25 Amazon gift card for their time.

## Where can I find the surveys?

Please find the survey for caregivers [here](#), and the survey for teens [here](#)
